Description

The Eppendorf Vis cuvettes are disposable cuvettes made of clear plastic material with a light transmission of 300 nm to 900 nm for spectrophotometers or photometers. The Vis cuvettes are particularly suitable for applications outside the UV range, e.g. colorimetric protein assays (Bradford, Lowry etc.), determination of the optical density of bacterial cultures (OD 600 methods) as well as kinetics and fluorescence measurements. Depending on the respective measurement volume, you can choose between the semi-micro cuvette and the macro cuvette.
